Block Loading Existing Transmission Commitments, Firm (ETC_F) Algorithm For Non-PTF Block Loading Facilities under Schedule 21-VEC

Portions of VEC's transmission can be electrically configured to accept deliveries directly from the Hydro Quebec (HQ) system, which is asynchronous with the New England (ISO-NE) system. To accept these HQ deliveries, VEC transfers portions of its system (electrical loads) from ISO-NE to HQ. The transfer of these radial loads to HQ is commonly referred to as "Block Loading".

VEC has obligations to serve its native loads and the connected loads of grandfathered Transmission Customers under Vermont Public Service Board jurisdictional transmission agreements. One of these non-OATT agreements is the Block Loading Facilities Agreement (BLFTA). BLFTA obligations will affect the contract path determination of ETC's. The availability of load for Block Loading limits the transferability of energy from HQ. VEC also has long-term firm OATT Schedule 21-VEC reservations to provide local point to point transmission for generation which is located within the Block Loading area which reduces the loads which can be physically connected to the HQ system.

For paths affected by HQ Block Loading, VEC prioritizes ETC_F components such that ETC_F cannot exceed the TTC. The prioritization order is as follows:

1. Firm transmission reservation (PTP_F) = generation located within the block load path that utilizes Firm Long-Term Schedule 21-VEC service.
2. Grandfathered Transmission Service (GF_F) = Hydro-Quebec Block Load third-party reservations submitted pursuant to the BLFTA.
3. Native Load forecast commitments (NL_F) = VEC's native load committed to accept VEC's Hydro-Quebec Block Load schedule reservations.
4. Network Integration Transmission Service (NITS_F) = firm capacity reserved for network integration service serving load.
5. Firm transmission reservations (ROR_F) = firm capacity reserved for Roll-over rights for contracts granting the Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.
6. OS_F = firm capacity reserved for any other service(s), contract(s), or agreement(s).

The ETC_F algorithm expressed in the order of prioritization is:

$$\text{Block Loading ETC}_F = \text{PTP}_F + \text{GF}_F + \text{NL}_F + \text{NITS}_F + \text{ROR}_F + \text{OS}_F$$

Where: the Block Loading ETC_F cannot exceed the Block Loading TTC

If the sum of the Block Loading ETC_F component reservations exceeds the TTC the availability will be curtailed in the reverse prioritization order. For example, OS_F would be curtailed first; ROR_F would be curtailed second; etc. If curtailments are required within a prioritization group and there are multiple Transmission Customers within the group the reductions will be made pro rata.

Vermont Electric Cooperative
